

# Prognostic Biomarker Qualification: Case Study: ADPKD and TKV

Arlene B. Chapman M.D.

Director, Section of Nephrology

University of Chicago

# Disclosures

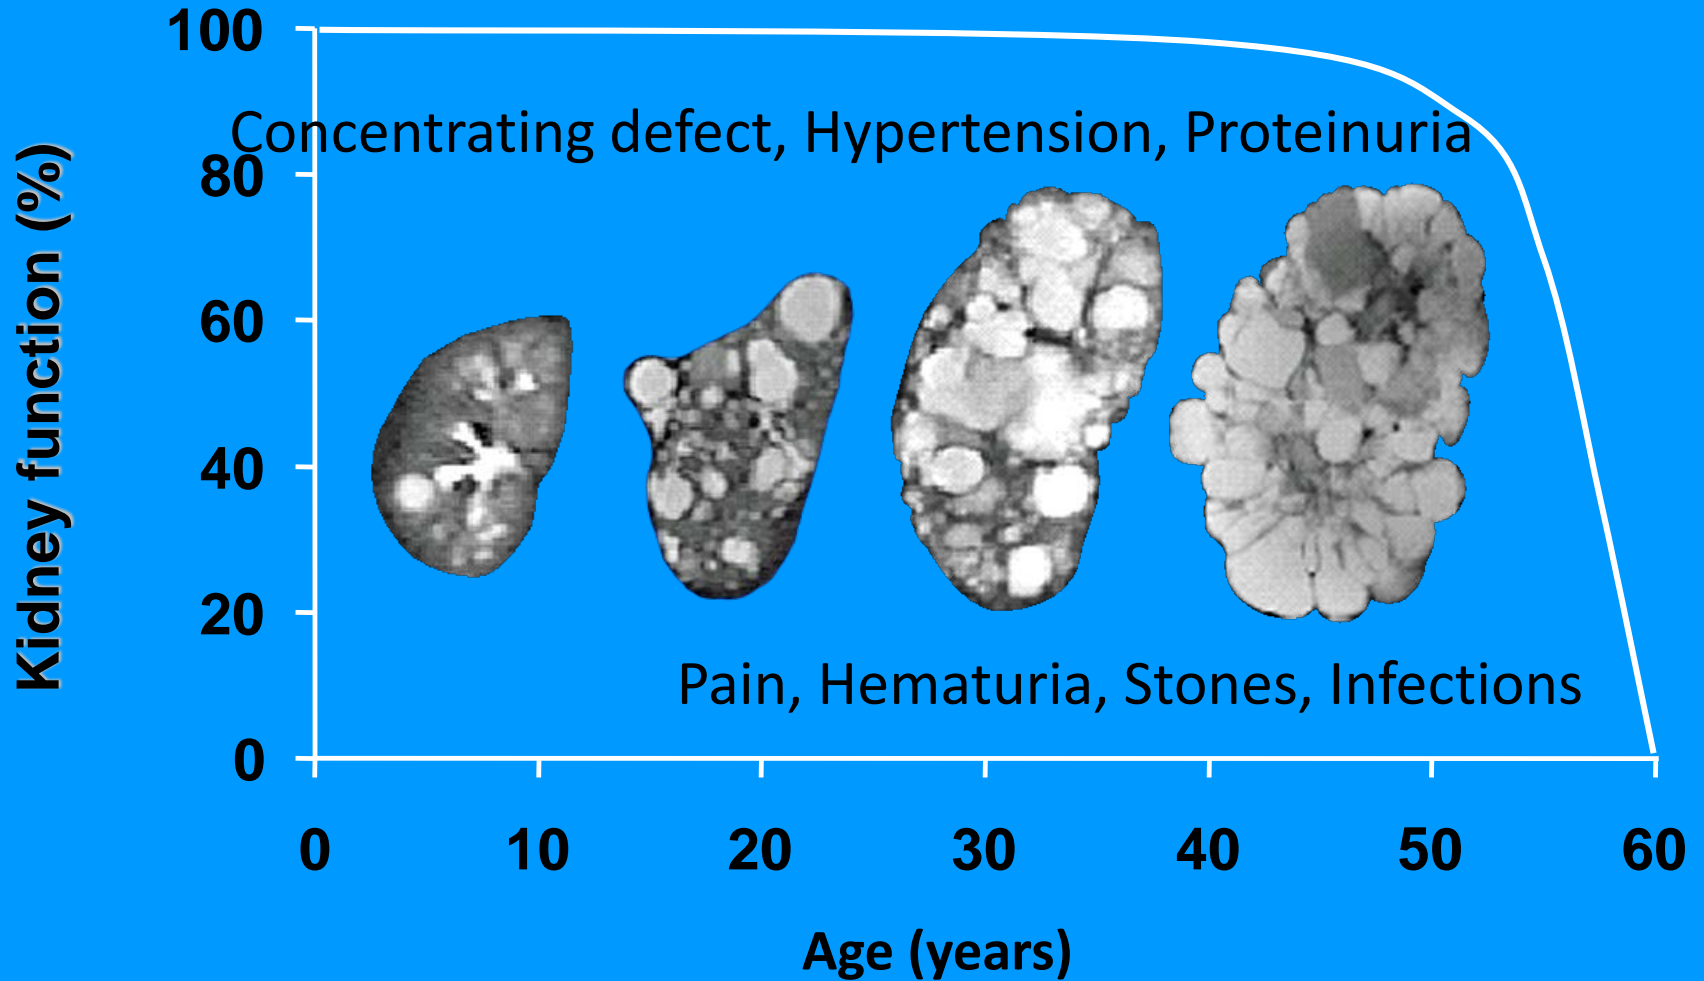

- Research Support:
  - Boston Scientific
- Consultation
  - Otsuka, Kadmon, Sanofi-Genzyme

# ADPKD

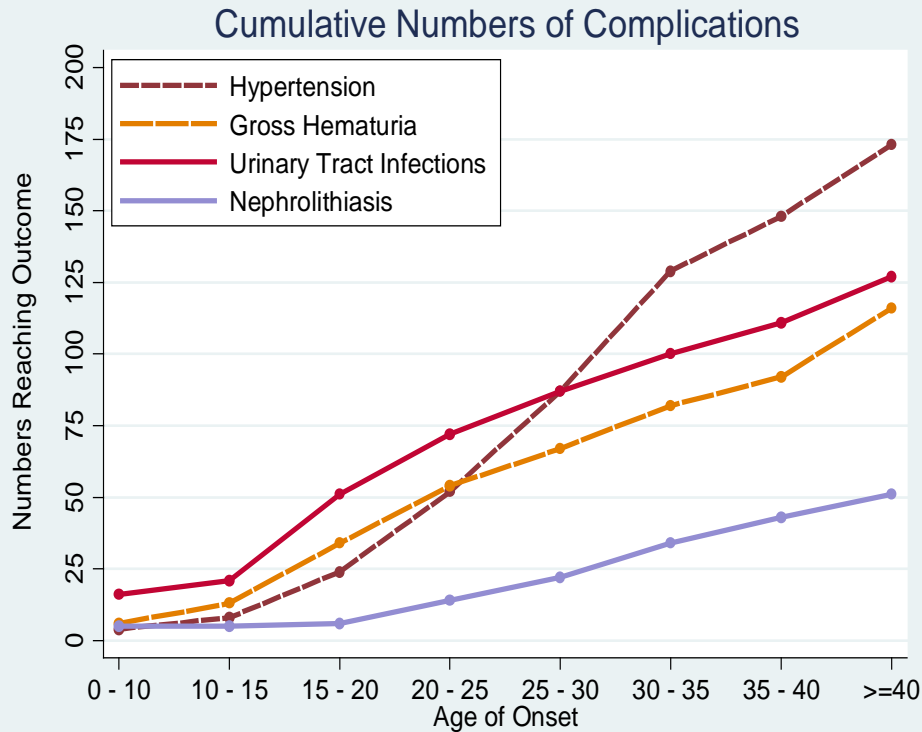

- 4th leading cause of ESRD
- No race/gender favored
- >3,000,000 worldwide
- Cysts
  - Kidneys
  - Liver
  - Pancreas
  - Spleen
  - Brain
- Begin *in utero*
- Develop in tubules
- Separate from tubules
- Isolated sacs

# ADPKD Progression

# ADPKD patients suffer renal complications prior to loss of kidney function

***By age 30, over 50% have at least one complication***

# Characteristics of ADPKD That Associate with ESRD

- **Genotype:** > 95% PKD1 individuals demonstrate renal cysts by age 30
- **Hypertension:** occurs in 60% with intact renal function by age 30
- **Proteinuria:** is not a common feature of this disease, but has important prognostic implications
- **Gross hematuria:** > 50% will have had an episode by age 40

**ALL CHARACTERISTICS HAVE NOW BEEN SHOWN TO MEDIATE THEIR RISK THROUGH KIDNEY VOLUME**

# CRISP

Consortium for Radiologic  
Imaging Studies of  
Polycystic Kidney Disease

Prospective longitudinal observational  
study with annual protocolized visits,  
MRIs and GFR measurements

Age 15-45 yrs

eGFR >70 ml/min

2/3 with hypertension <35 yrs  
or PrU >300 mg/d

**Inter-observer variability: 2.1%**  
**Intra-observer variability: 2.4%**  
**Day-to-day variability: 2.4%**

# Increased Kidney Volume is Due to Increased Cyst Volume

**Kidney growth is highly variable and each individual has their own growth curve**

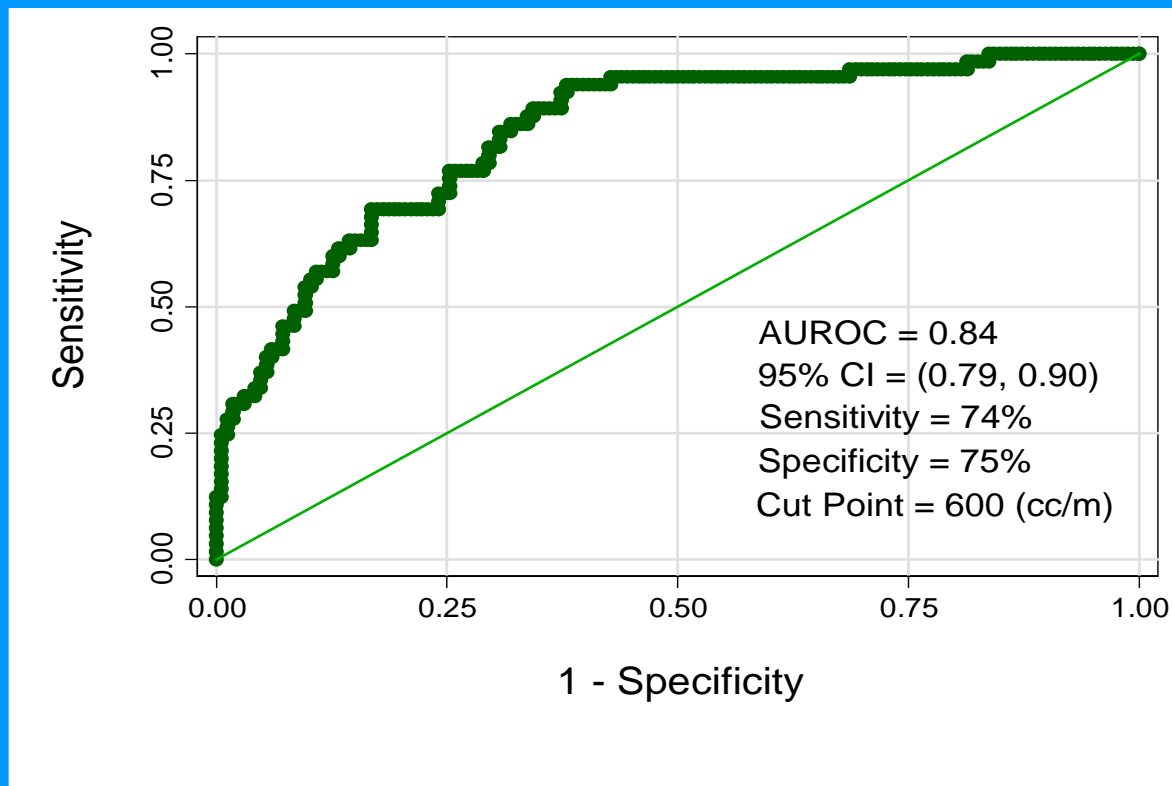

Measurement variability= Inter-observer 2.1%, Intra-observer 2.4%, Day-to-Day 2.4%

Grantham, *NEJM CRISP* 2006; Chapman *Kidney Int* 64; 1035–1045, 2003

# Change in Kidney Volume Precedes Change in Kidney Function

p<0.05 for htTKV change from baseline; # p<0.05 for GFR change from baseline; htTKV=Height-adjusted total kidney volume; <sup>1</sup> Percent Change Standardized to a common unit; NIH CRISP Studies; Chapman CJASN 7:479, 2012

# QUALIFICATION OF TOTAL KIDNEY VOLUME AS A PROGNOSTIC BIOMARKER FOR USE IN CLINICAL TRIALS EVALUATING PATIENTS WITH AUTOSOMAL DOMINANT POLYCYSTIC KIDNEY DISEASE

RD Perrone, JF Marier, MS Mouksassi, F Czerwiec, K  
Romero, E Dennis, D Miskulin, A Chapman, B Gitomer, and  
VE Torres for the PKD Outcomes Consortium

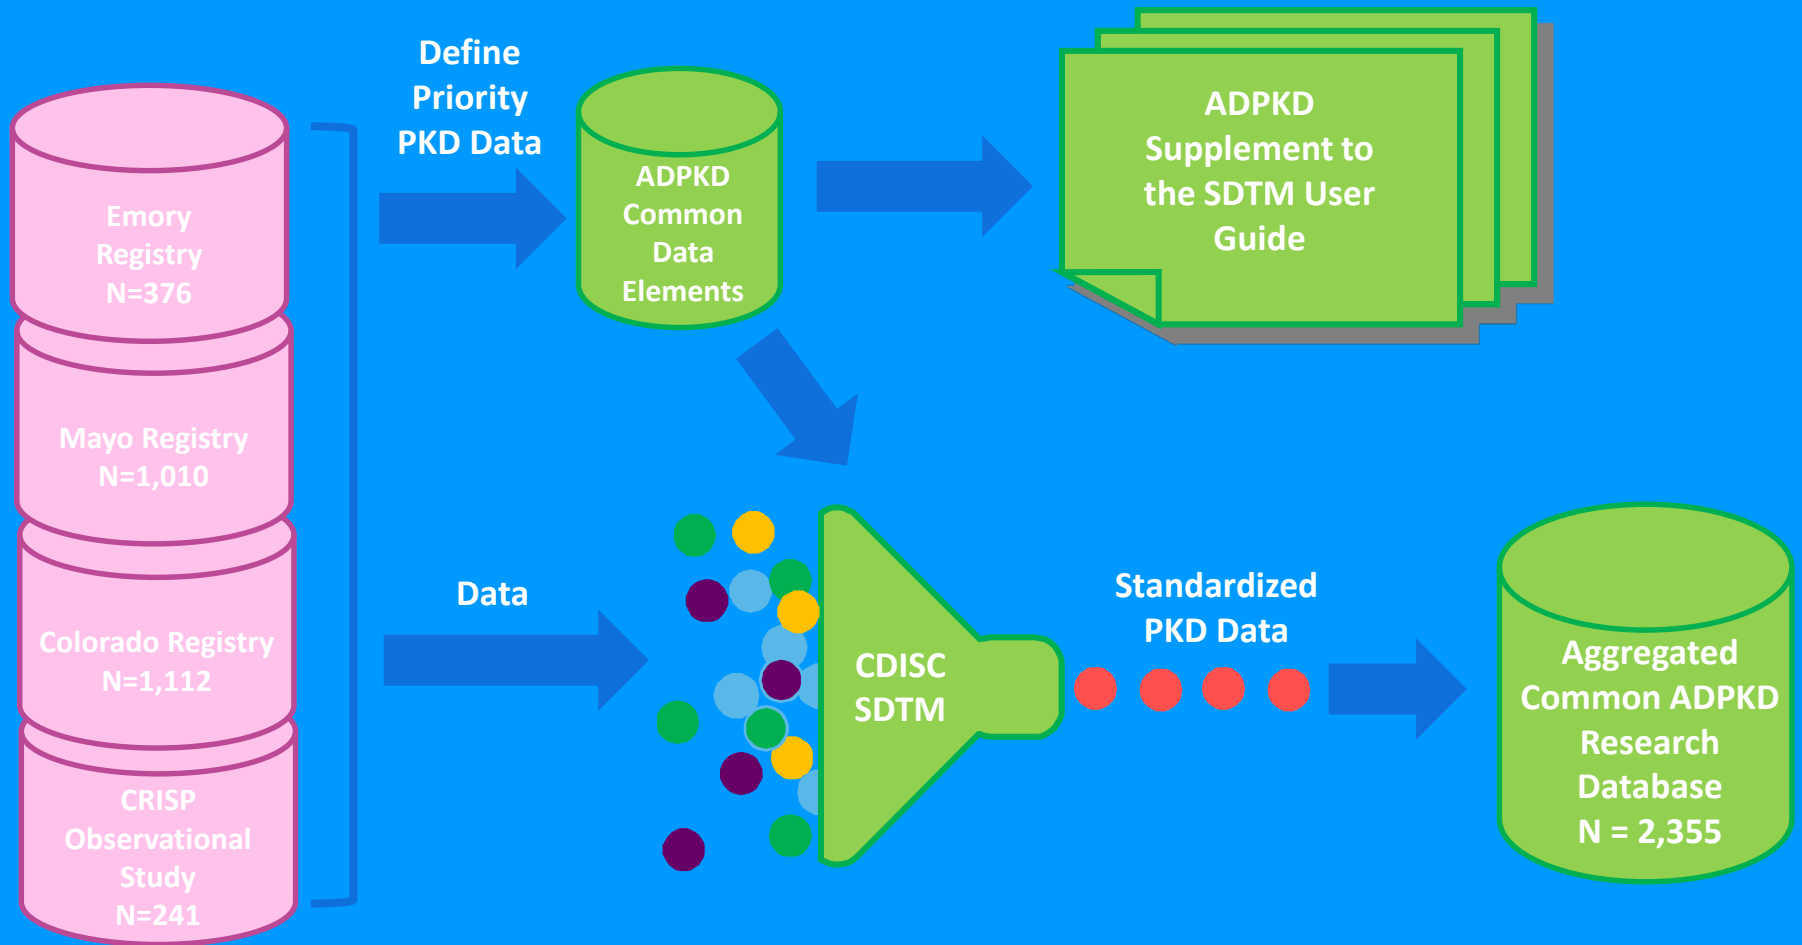

# Primary Research Objectives

- Determine the predictive value of TKV, baseline eGFR, baseline age and other prognostic factors (e.g., sex, PKD mutation, race) in estimating the risk of worsening of eGFR and ESRD to support the regulatory qualification of TKV as a prognostic biomarker for use in clinical trials.
- Develop a joint model that can simultaneously assess longitudinal TKV measurements and the probability of disease outcome. Use the above joint model as a drug development tool (DDT) for trial enrichment strategies.

# Decision Tree for Use of Baseline TKV for Prognostic Clinical Trial Enrichment

# PKDOC Data Overview and Summary

# Trial Enrichment Using TKV: Highest Risk of Progression

| Follow-Up<br>Times<br>(Years) | Probabilities of Avoiding 30% Worsening of eGFR |                        |                        |                        |                        |                        |                        |                        |

# Predicted Probability at Baseline of Avoiding a 30% Decline in eGFR: Effect of Baseline TKV

Predicted Probability at Baseline of Avoiding a 30% Decline in eGFR

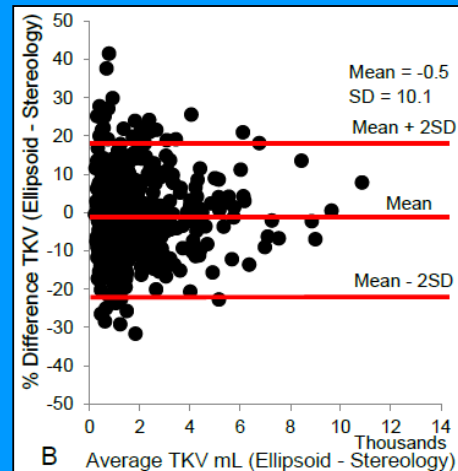

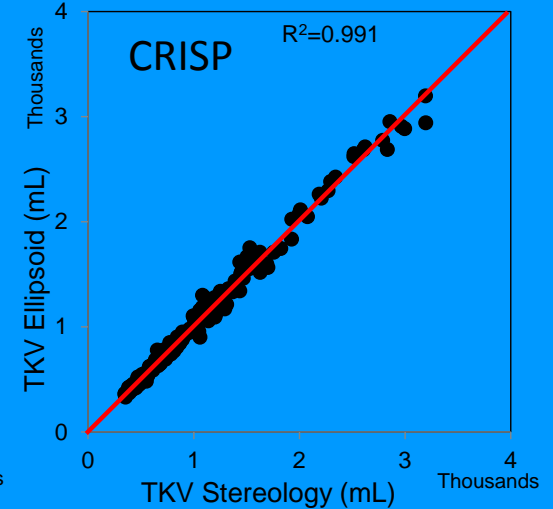

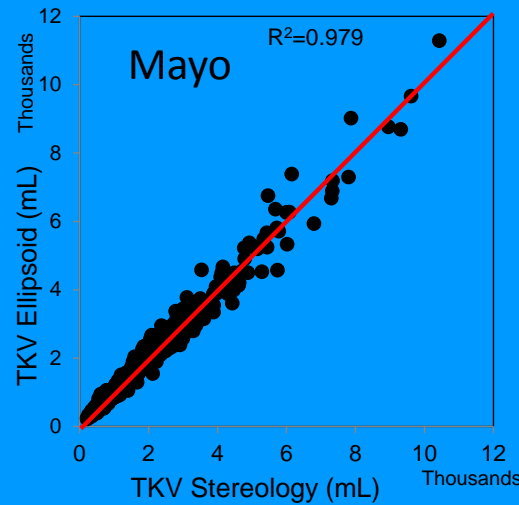

# Classification of ADPKD patients

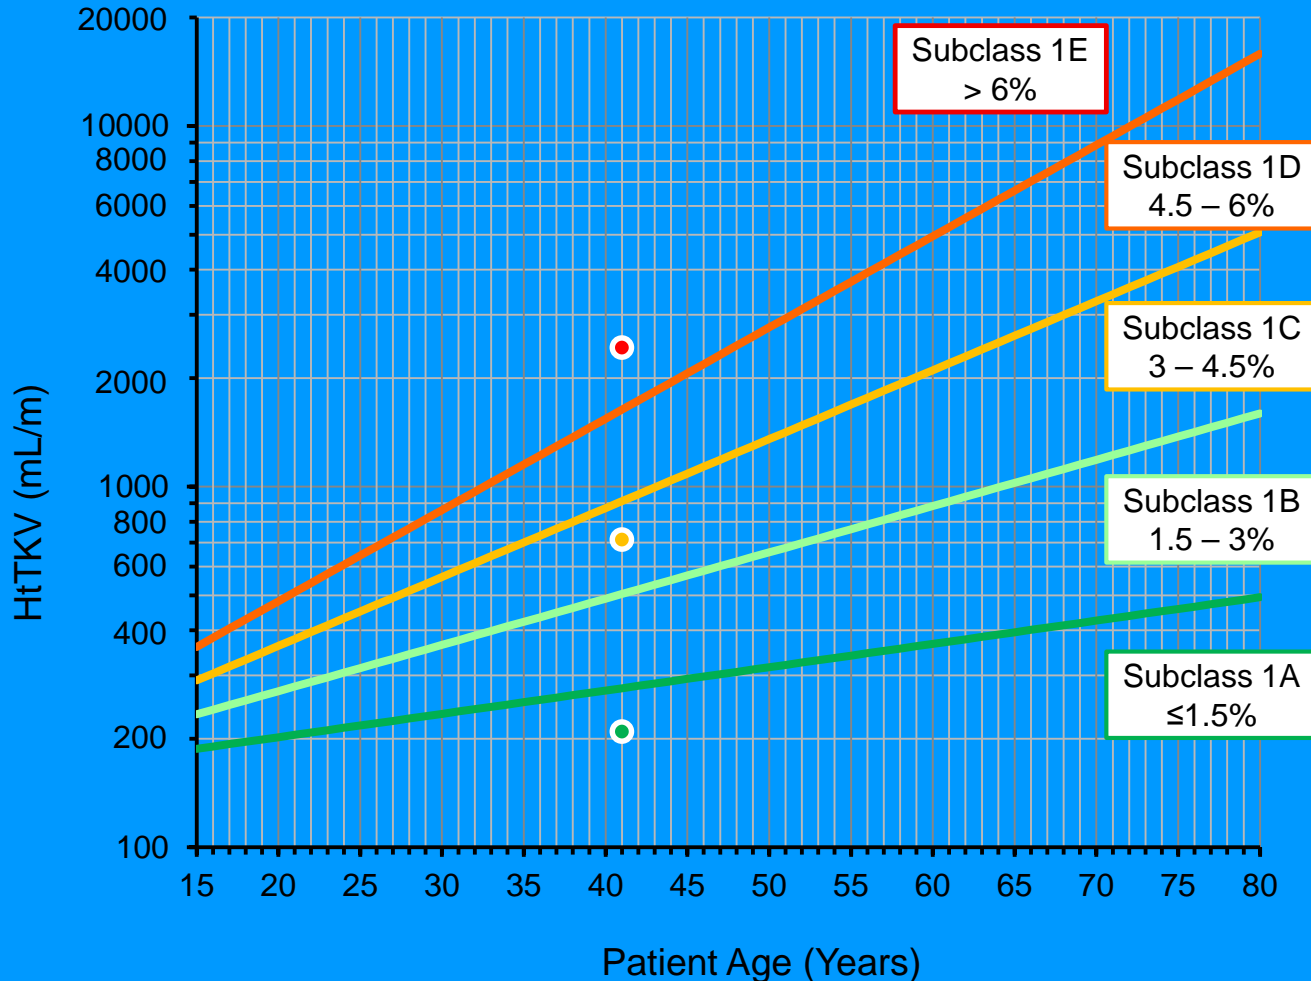

## Pre-specified imaging findings

| Class | Sub class     | Term   | Description  |
|-------|---------------|--|--|
| 1     | Typical ADPKD |  | <b>Cyst distribution is bilateral and diffuse with relatively even contribution to TKV</b> |
| 2     | A             | <i>Unilateral</i>  | Normal contralateral kidney with $\leq 2$ cysts  |
|       |               | <i>Asymmetric</i>  | Mild involvement of contralateral kidney with 3-9 cysts and $< 30\%$ of TKV.               |
|       |               | <i>Segmental</i>   | Involvement only one pole of one or both kidneys   |
|       | B             | <i>Lop-sided</i>   | Mild replacement of kidney tissue with $\leq 5$ cysts accounting for $\geq 50\%$ TKV.      |
|       |               | <i>Bilateral presentation w/ acquired unilateral atrophy</i> | Atrophy of contralateral kidney.   |
|       |               | <i>Bilateral presentation w/ bilateral kidney atrophy</i>    | Length $< 14.5$ cm, atrophy of parenchyma and $SCr \geq 1.5$ mg/dL                         |

# TKVe correlates strongly with TKVs

# Classification by Estimated Rate of Growth (from age and starting HtTKV = 150 ml/m)

# Post-Hoc Analysis: HALT PKD Study A

## Distribution of Patients by Class at Baseline

Class 1: 94.6%

Class 2: 5.4%

N = 551

# Image Classification of HALT PKD Study A Patients

# Value of Image Stratification of ADPKD

## HALT PKD Study A as a Model

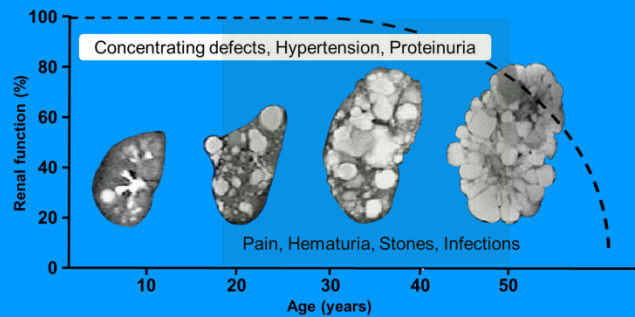

- Class severity associates with greater rates of TKV increase and eGFR decline
- Changes in TKV and eGFR are negatively correlated
- The treatment effect of low BP increases with class severity
- In the patients with the most severe disease (class D-E), low BP associates with slower eGFR decline after month 4 and overall
- Restriction of enrollment to class 1D-E patients would have detected a stronger low BP effect on TKV growth and EGFR decline, with a much lower number of patients (187 vs 551)
- These results stress the importance of optimal patient selection to reduce the cost and the chance of a type II error

# Interventional trials designed based on disease natural history

## Trial Population Mid-Stage ADPKD

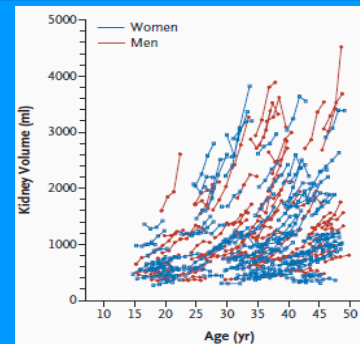

Significant cystic burden for age  
*TKV  $\geq$  750 ml Age 18-50*

Preserved kidney function  
*CKD 1-3: eCrCl >60 ml/min*

## Endpoints: Disease Specific Modifiable Outcomes

Cyst Growth  
by TKV

Kidney  
Function  
Decline
