#75 Enabling efficient use of digital health technologies to support Parkinson's disease drug development through precompetitive collaboration

**Background**

The Parkinson's Foundation (PF) has a long history of supporting research in the search of better treatments and the ultimate cure for Parkinson's disease. In 2018, the PF launched the Parkinson's Disease Research Accelerator (PDRA) to support the development of new digital health technologies that have the potential to improve the lives of people with Parkinson's disease. The PDRA is a precompetitive collaboration between the PF and several leading digital health technology companies, including Microsoft, IBM, and Google. The PDRA is designed to accelerate the development of digital health technologies that have the potential to improve the lives of people with Parkinson's disease. The PDRA is a precompetitive collaboration between the PF and several leading digital health technology companies, including Microsoft, IBM, and Google. The PDRA is designed to accelerate the development of digital health technologies that have the potential to improve the lives of people with Parkinson's disease.

**Objectives**

The PDRA is designed to accelerate the development of digital health technologies that have the potential to improve the lives of people with Parkinson's disease. The PDRA is a precompetitive collaboration between the PF and several leading digital health technology companies, including Microsoft, IBM, and Google. The PDRA is designed to accelerate the development of digital health technologies that have the potential to improve the lives of people with Parkinson's disease.

**Methods**

The PDRA is designed to accelerate the development of digital health technologies that have the potential to improve the lives of people with Parkinson's disease. The PDRA is a precompetitive collaboration between the PF and several leading digital health technology companies, including Microsoft, IBM, and Google. The PDRA is designed to accelerate the development of digital health technologies that have the potential to improve the lives of people with Parkinson's disease.

**Results**

The PDRA is designed to accelerate the development of digital health technologies that have the potential to improve the lives of people with Parkinson's disease. The PDRA is a precompetitive collaboration between the PF and several leading digital health technology companies, including Microsoft, IBM, and Google. The PDRA is designed to accelerate the development of digital health technologies that have the potential to improve the lives of people with Parkinson's disease.

**Conclusions**

The PDRA is designed to accelerate the development of digital health technologies that have the potential to improve the lives of people with Parkinson's disease. The PDRA is a precompetitive collaboration between the PF and several leading digital health technology companies, including Microsoft, IBM, and Google. The PDRA is designed to accelerate the development of digital health technologies that have the potential to improve the lives of people with Parkinson's disease.
