Functional Dyspepsia Working Group
 Presented at the Ninth Annual PRO Consortium Workshop – Silver Spring, MD – April 25-26, 2018

Background

Functional Dyspepsia (FD) Working Group (WG)

The FD WG was established to develop a consensus statement on the management of FD, based on the current evidence and clinical practice. The WG was formed by experts in the field of FD, including gastroenterologists, dietitians, and psychologists. The WG's goal was to develop a consensus statement that would provide guidance to clinicians and patients on the management of FD.

Consensus Statement Language

The consensus statement was developed through a series of meetings and discussions. The WG members agreed on the following key points:

- FD is a common condition that affects the upper gastrointestinal tract.
- FD is characterized by symptoms such as epigastric pain, bloating, and early satiety.
- FD is not caused by structural disease of the upper gastrointestinal tract.
- FD is a chronic condition that requires long-term management.
- FD is managed with a combination of lifestyle changes, dietary modifications, and medications.
